## VG and Ryan's Surprise expand

TSX-V: WGO | OTCQX: WHGOF | Frankfurt: 29W

Latest drilling supports growth beyond the existing resource model at VG, with further extensions at Ryan's Surprise. [1]

| Drill interval | Gold grade         | Core length    |
|----------------|--------------------|----------------|
| VG: QV26-025   | <b>2.73 g/t Au</b> | <b>21.75 m</b> |
| including      | 4.18 g/t Au        | 8.80 m         |

Intervals are core lengths; estimated true widths are 80-95%. [1]

### What matters in this release

**VG:** Mineralization is now supported to approximately **350 m down-plunge**, compared with the current resource model's approximately 230 m limit. The reported 120 m extension reflects the combined drilling evidence, including previously announced holes. [1]

**Ryan's Surprise:** Drilling extends stacked mineralized lenses approximately **50 m east and 50 m west**. Results are mixed: some holes intersected multiple gold zones, while one returned no significant results. [1]

**Next catalyst:** Assays remain pending for **44 holes** from the fully funded 2026 diamond drilling program. [1]

### LuxMetals Invest perspective

VG is the strongest result in this release: a substantial gold interval strengthens the evidence for continuity outside the existing resource model. Ryan's Surprise adds expansion potential, although results are less consistent. These findings support potential resource growth; they do not yet establish additional resource ounces or improved project economics.
